## Research Interests

My research focuses on measuring the value of childhood health interventions using methods of decision sciences and economics. Current research topics include evaluating long-term health and economic outcomes for newborn screening programs using simulation modeling, measuring public values for prevention programs, and developing new methods for valuing family spillover effects of childhood illness. My applied research on the economic impact of immunization programs has been used in setting national vaccine policy. My research using decision modeling to estimate outcomes for newborn screening programs has been used to inform national policy decisions on the recommended uniform screening panel. My methodological research focuses on methods for valuing child health for cost-effectiveness analysis and the measurement of family spillover effects of illness on quality of life.
